### ABSTRACT

This Special Labor Force Report of March 1973, shows a continued decline in labor force participation rates of married men and an increase in rates of married women with young children. It also explores the trends of husbands and wives labor force participation, as well as labor force activity of other groups, such as women heads of families and single persons. Data by race as well as by family income are presented. Most of this information is based on the annual nationwide survey of the marital and family characteristics of workers. (Appended to the report are an explanatory note, and numerous statistical tables and charts.) (Author/BP)

Employment and Unemployment in 1973

163

Special Labor Force Report shows continued decline in labor force participation rates of married men and increase in rates of married women with young children

HOWARD HAYGHE

More than two decades of socioeconomic change have chipped away at the numerically dominant labor force position of married men in relation to that of their wives. Since 1953, the labor force participation rate for married men has gradually drifted downward—from 92 to 85 percent in 1973—while the rate for married women has persistently risen—from 26 to 42 percent. Thus, in March 1973, for every two married men in the labor force, one married woman was also working. (See table 1.) Ten years before, the ratio

Declines in the labor force rates of married men 55 and over have been largely responsible for the husbands' downward trend, while married women, even with preschool children, have become more firmly attached to the labor force. This article explores the trends of husbands' and wives' labor force participation, as well as labor force activity of other groups, such as women heads of families and single persons. Data by race as well as family income are also presented. Most of this information is based on the annual nationwide survey of the marital and family characteristics of workers.

stood at 2.6 to 1, and 20 years earlier it was 3.5 to 1.

### Labor force participation rates

In March 1973, the 84.8-percent labor force participation rate of married men, wife present, was down somewhat from the year before—a continuation of the downward trend extending back more than 20 years, to the early post-World War II period. (See table 2.) The decline in the rate had concentrated among those 55 years and over. Before 1963, most of the decline in the rate

# Marital and family characteristics of the labor force in March 1973

took place among men age 65 and over. Following 1963, the decline among men 65 and over slowed markedly, and the rate of those 55 to 64 began trending downward. The rate of men 45 to 54 did not start to decline to any appreciable extent until the end of the sixties.

Aside from the factor of voluntary retirement, which has become more common among men below age 65 and has undoubtedly contributed to the decline in labor force participation rates, there has been an increase in the proportion of men who report that they are either limited in their activities or unable to work because of health problems. In 1969 and 1970, 21.1 percent of all men 45 to 64 years of age, compared with 8.4 percent in ages 17 to 44, reported chronic health conditions, such as heart disease, hypertension, emphysema, or psychological problems, which limited their activity. The proportion of men 45 to 64 reporting chronic health conditions which prevented them from carrying on their major activity rose from 4.5 percent in the period July 1965-June 1967 to 7.3 percent in 1969-70,2 while less than 2 percent of the younger men in both periods were unable to carry on their major activity,

The increasing incidence of reported health problems among older men is supported by other data. According to annual average data from the Current Population Survey, 3.2 percent of all men 55 to 64 said they were unable to work in 1963 because of mental or physical incapacity; 6.0 percent gave that reason in 1973. Also, the proportion of men 55 to 64 receiving disability benefits nearly doubled, rising from 4.4 percent in 1962 to 8.2 percent in 1972. While these percentages are not in themselves definitive, they do indicate a connection between increases in reported health problems among older men and the decline in their labor force participation rates. Further study is necessary to clarify this point.

21

Lack of education has also been a factor in the decline in rates among men 55 to 64 years old. In an economy which requires high educational and skill levels on the part of workers, those who lack this "human capital" are at a disadvantage in finding and holding a job and are more likely to be out of the labor force than better educated persons. Thus, it is not surprising to find that the labor force participation rates for men aged 55 to 34 without high school diplomas declined more rapidly since 1962 (1963 data are not available)

than the rates for those who had completed high school, as shown below:

|               |                   | March | March | De-    |
|---------------|-------------------|-------|-------|--------|
| Years of scho | ol completed      | 1962  | 1973  | crease |
| Elementary:   | 8 years or less   | 83.9  | 70.9  | 13.0   |
| High school:  | I to 3 years      | 89.1  | 79.3  | 9.8    |
| _             | 4 years           | 90.6  | 84.9  | 5.7    |
| College:      | 1 to 3 years      | 89.1  | 83.9  | 5.2    |
| _             | 4 years or more . | 93.8  | 87.0  | 6.8    |

Another factor in the declining labor force participation rate of husbands 55 to 64 years old

<sup>.</sup> The male labor force includes members of the Armed Forces, living off post or with their families on post.

beginning with 1972 as well as the introduction of 1970 census data into the estimation procedures. For an explanation of the effects of the introduction of 1970 census data, see "Revisions in the Current Population Survey," Employment and Earnings, February 1972, pp. 6-9.

NOTE: Numbers for periods beginning with March 1972 are not strictly comparable with data for earlier years because of the exclusion of the institutional population

may relate to the labor force participation rate of their wives, which has increased in recent years. Many women in the 55 to 64 age group are working so as to increase or qualify for social security benefits, as well as to accumulate preretirement savings. Husbands of these women, therefore, are not under as much of an economic constraint to continue working to provide adequate retirement income, and they may be able to retire earlier than in previous years.

The labor force participation rate of Negro<sup>4</sup> married men in March 1973, at about 85 percent, was the same as for whites. Since 1965 the rate of Negro husbands has declined at about the same pace as that of whites. Among Negro married men, the decline occurred in the age groups 16 to 34 and 45 to 64, while among whites it occurred largely among men 55 years and over.

The number of single men in the labor force rose over the year, and their participation rate edged up to 66 percent. Most of the rise in the number occurred among teenagers and men 20 to 24 years old. There was no statistically significant change in the labor force participation rate of single Negro men and women. The number of single Negro men in the labor force reached 1.5 million in March 1973, up 130,000 over the preceding 12 months; for single Negro women, the comparable numbers were 1.1 million and 100,000.

Married women continued to be a growing segment of the labor force. Their participation rate rose to 42.2 percent over the year ending in

March 1973, sustaining its long-term upward trend. The rate rose faster in the 1960's than in the two preceding decades as the result of a combination of factors, including increases in the educational level of married women, greater acceptance of working wives and mothers, and the increased demand for workers. Contributing in no small measure to the rising labor force rates of wives was also the rapid expansion of four broad industry groups—services, government, retail trade, and manufacturing. Between January 1964 and January 1973, about 90 percent of the increase in payroll employment of women occurred in these industries.<sup>5</sup>

The limiting effects of the presence of preschool children on the labor force participation of married women are reflected in differences between the rates of mothers by age of children. Only a third of the mothers with children under 6 were in the labor force in March 1973, compared with about half whose children were 6 to 17 years old. (See table 3.) Yet, the participation rate of wives with preschool children has risen sharply over the past decade. The rate for mothers whose youngest child was 3 to 5 years old rose by 13.2 percentage points since 1960 to 38.3 percent in March 1973. Over the same period, the participation rate of mothers with children under 3 rose by about the same number of points to 29.4 percent.

Income. As might be expected, median income of families in which both parents worked was greater

Labor force as percent of population.

 $<sup>^{2}</sup>$  Prior to 1967, the labor force included persons 14 and 15 years old. In  $^{1}$  -.7 and

later, only persons 16 years and over are included.

<sup>3</sup> Not available.

than when the mother did not work. However, as shown below, families with preschool children had a lower median income in 1972 than did families with older children:

|                         | Children | Children |
|-------------------------|----------|----------|
|                         | 6 to 17  | under 6  |
| Wife in labor force     | \$14,760 | \$11,950 |
| Wife not in labor force | 13,110   | 10,900   |

This income differential between families with children under 6 and those with children 6 to 17 reflects the difference in the median incomes of their fathers:

|                         | Children | Children |
|-------------------------|----------|----------|
|                         | 6 to 17  | under 16 |
| Wife in labor force     | \$10,580 | \$8.710  |
| Wife not in labor force | 12,110   | 10,150   |

The lower income of fathers with young children reflects the younger age of the fathers, many of whom are just starting their careers and are, therefore, likely to be earning less than are older, better established men.

Despite economic gains, the income of Negro husbands remains, on average, below that of white husbands, a persistent disparity which is among the important elements that account for the continually higher rates of labor force participation of Negro than of white wives. Median income in 1972 (the latest year for which income

Labor force as percent of population.

data are available) of husbands who were nonfarm residents was \$6,760 for Negroes and \$9,640 for whites. The disparity between the incomes of Negro and white husbands has narrowed somewhat over the decade (in constant 1972 dollars, median income of Negro husbands in 1962 was \$4,460 compared with \$7,660 for whites), but there has been no significant change in the absolute differential between the participation rates of Negro and white wives:

|           |             | Wive.<br>labor j<br>(in th<br>sand | force<br>ou- |       | abor fo<br>icipatio |                 |

|           |             | 1,517                              | 12,544       | 44.8  | 32.7                | 12.1            |
| 1965 .    |             | 1,676                              | 13,032       | 46.7  | 33.6                | 13.1            |
| 1968 .    |             | 1.794                              | 15,027       | 49.9  | 37.2                | 12.7            |
| 1973      | . <b></b> . | 2,093                              | 17,728       | 54.0  | 41.2                | 12.8            |

Since 1965, the increases in the number of both white and Negro wives in the labor force has been greater among young wives (under 35), owing in part to population increases in the age group. Of the 417,000 increase among Negro wives, 68 percent were under 35; of the 4.7-million increase among whites, 63 percent were under 35.6

### **Families**

In March 1973, there were 54.4 million families in the United States. About 46.3 million were husband-wife families; 6.6 million were headed by widowed, divorced, or separated women, and 1.5 million by formerly married men. (See table 4.) The proportion of all families headed by married men continued its slow, long-term decline, even though their number grew by some 560,000 over the year. At the same time, the number of families headed by women increased considerably by 415,000, bringing their proportion of all families to 1 out of 8, compared with 1 out of 10 a decade earlier.

As in the past several years, a large part (44 percent) of the 1972-73 increase in the number of families headed by women resulted from divorce and separation, rather than death of husband. The divorce rate (number of divorces per 1,000 population) reached 40 in 1972 and continued to climb to 4.3 during the first 9 months of 1973, matching the all-time high of 4.3 recorded in

1946.7 The increase in the divorce rate is a continuation of an upward trend that began in 1963 and accelerated markedly in 1968. The rate has nearly doubled in the past 10 years. For the last 5 years, the average yearly rate of increase in the rate was 11 percent.8 Thus, as a result, in March 1973, half of all women family heads were divorced or separated, 37 percent were widows, and 13 percent were single; 5 years earlier, these proportions were 44, 46, and 10 percent, respectively.

Husband-wife families. In line with the rising labor force participation of married women, families with more members than one in the labor force have become increasingly more common. In March 1963, there were close to 17 million, or 47 percent, of husband-wife families which, in addition to the husband, had other members in the labor force. By March 1973, multiple-worker families had increased to nearly 22 million, or 56 percent of the husband-wife families: 36 percent with only the wife and husband in the labor force, 10 percent with wife, other relative, and husband in the labor force; and 10 percent with only a relative other than the wife and husband in the labor force.

The increasing labor force attachment of wives has been instrumental in raising family income. For families where the wife worked at some time during the year, real family income (measured in constant 1972 dollars) rose by 37 percent, on average, between 1962 and 1972. The rise was only 28 percent on average in families where the wife had not worked at all. The increasing importance of the wife's earnings is emphasized by the differential in income between nonfarm families in which the wife had work experience and those in which she had none. This differential in median income (in 1972 dollars) widened from 21 percent in 1962 to 29 percent in 1972:

|      | Wife did<br>not work<br>during<br>year | Wife<br>worked<br>during<br>year | Differ-<br>ence<br>(percent) |  |
|------|--|----------------------------------|------------------------------|--|
| 1962 | \$8,260                                | \$9,960                          | 21                           |  |
| 1967 | 9,720                                  | 12.130                           | 25                           |  |
| 1972 | 10.580                                 | 13.620                           | 29                           |  |

Women who head families. The labor force participation rate for women who headed families remained steady at 53.2 percent in March 1973 (table 4), about the same as it had been for

Table 4. Labor force status of family head, by type of family, 1 March 1972 and March 1973

<sup>4</sup> includes primary and secondary families only.

several years; the proportion of multiple-worker families also remained at the same level of about 36 to 38 percent. With the exception of young women 16 to 24 years old, the majority of those women heads of families who worked tended to work all year. (See table 5.) However, those who looked for work during the year experienced considerable difficulty finding employment. About 42 percent of those who had worked during 1972 and had experienced some unemployment were unemployed at least 27 weeks, and 35 percent were jobless at least 15 weeks during the year. Long-term unemployment such as this may be the result of difficulties in finding work compatible with their home responsibilities.

Median income for female-headed families is relatively low, even though more than half (54 percent) of those who have work experience work year round full time. In 1972, median income for these families was \$5,380 compared with \$12,070 for husband-wife families and \$10,350 for families headed by men who were widowed, divorced, or separated, reflecting in part the fact that a greater proportion of men worked year round full time and had higher earnings.

Includes members of Armed Forces living off post or with their families on post.

Where the female family head worked, her earnings, although low, were the economic mainstay of the family. In 1972, working women who headed families had median earnings of \$4,140, and their median contribution to their family income was nearly two-thirds. Those who worked year round full time had earnings of \$5,980 and contributed three-fourths of the total family income.

Negro and other races. In March 1973; I out of 9 of all American families was Negro.<sup>9</sup> As among whites, husband-wife families predominated, but a larger percentage of Negro families were headed by women, as shown below:

| Type of family       | Negro and other races | White |
|----------------------|-----------------------|-------|
| Husband-wife         | 63                    | 88    |
| Other male head      | . 4                   | 2     |
| Female-headed family | 33                    | 10    |

The proportion of Negro husbands who were in the labor force, 84.5 percent, was about the same as for whites.

Multiple-worker families have been more common among Negro than among white husband-

wife families for some years, a reflection of the greater labor force participation of Negro than of white wives. In 1965, 58 percent of the Negro families in which the husband was in the labor force had other members in the labor force as well, compared with about 46 percent of the white families. These proportions have risen in line with the rising labor force participation rates of wives, so that in March 1973, they were 65 and 55 percent, respectively. (See table 6.)

Income of Negro husband-wife families, like that of similar white families, varied by the number of earners in the family. The more earners, the higher the income. Where there was only one earner, the median family income in

1972 was \$6,960 and \$10,710, respectively, for Negroes and whites; where there were at least three earners, the family income was \$14,380 for Negroes and \$17,510 for whites.

Median earnings of Negro and white wives were about the same—\$3,650 and \$3,550, respectively. Where the wives worked year round at full-time jobs, white wives earned more, having median earnings of \$9,880 compared with \$6,670 for Negroes. Nonetheless, the earnings of Negro wives, as in the past, constituted a larger proportion of family income than did the earnings of white wives, 32 and 26 percent, respectively, underlining the fact that the income of Negro husbands is lower than that of white husbands.

Nearly one-third of the female-headed families were Negroes; the proportion of families who are Negroes has been increasing steadily since 1965; it was 30 percent in 1973, 28 percent in 1969, and 25 percent in 1965. Over half the increases in all female-headed families during the year ending in March 1973 was among Negroes. The proportion of Negro women family heads who were in the labor force remained smaller than was the case with white women, 49 and 55 percent, respectively. In addition, the unemployment rate for these Negro women was about twice that of whites, 11.5 compared with 5.0 percent.

Median income in 1972 was lower among Negro than among white female-headed families, \$4,000

and \$6,270, largely because of lower earnings of Negro women. Negro female family heads had median earnings of \$3,370 compared with \$4,460 for white women. The lower earnings of Negro women reflect not only fewer weeks worked during the year, but also their heavy concentration in low-skill, low-pay jobs: 43 percent of employed Negro female family heads worked in service occupations (including private household worker) compared with 24 percent of the whites. Moreover, among women working all year at full-time jobs, the Negro family heads had lower earnings than the white—\$5,170 and \$6,200.

White women heads of families not only earned more, but also appeared to have other or better sources of unearned income than did their Negro counterparts. These sources , anged from alimony and child support payments to pensions and social security benefits, as well as income from investments. In addition, a larger proportion of white than of Negro families whose head was in the labor force had other family members in the labor force, 39 compared with 29 percent. Thus, even though they earned less, Negro women family heads contributed relatively more through their earnings to their families' incomes than did whites. Negro women family heads contributed, on average, 70 percent of their families' incomes through their earnings (86 percent if they worked all year full time) compared with 63 percent for whites (75 percent on year-round, full-time basis), [3]

---F001N01ES----

This article is based primarily on information from supplement by questions in the March 1973 monthly survey of the labor force, conducted for the Bureau of Labor Statistics by the Bureau of the Census through its Current Population Survey. Most of the data relate to the noninstitutional population 16 years old and over, including those members of the Armed Forces living off post or with their families on post (979,000 in March 1973). Sampling variability may be relatively large in cases where numbers are small. Therefore, small differences between estimates or percentages based on them should be used and interpreted with caution.

This is the 15th annual report on this subject. The most recent report contained data for March 1972 and was published in the *Monthly Labor Review*. April 1973, pp. 31-36. It was reprinted with additional tabular data and an explanatory note as *Special Labor Lorce Report 153*.

### EXPLANATORY NOTE

ESTIMATES in this report are based on supplementary questions in the March 1973 Current Population Survey conducted and tabulated for the Bureau of Labor Statistics by the Bureau of the Census. Basic labor force concepts, sample design, estimating methods, and reliability of the data are described briefly in the following sections. 1

### DEFINITIONS AND EXPLANATIONS

Population Coverage. Each month, trained interviewers collect information from a sample of about 47,000 households in 461 areas in 923 counties and independent cities with coverage in every State and the District of Columbia. Estimates in this report include persons 16 years old and over in the civilian noninstitutional population in the calendar week ended March 17, 1973. Maie members of the Armed Forces living off post or with their families on post (979,000 in March 1973) were also included, but all other members of the Armed Forces were excluded.

Data for 1972 and subsequent years are not strictly comparable with data for earlier years. Beginning with 1972, the institutional population was excluded from the estimates and 1970 census data were introduced into the estimation procedure. The exclusion of the institutional population decreased somewhat the number in the population and increased slightly the labor force participation rates of single persons and formerly married persons. Information on effects of introduction of 1970 census data on population and labor force can be found in "Revisions in the Current Population Survey," in Employment and Earnings, February 1972, pp. 6-9.

Marital Status. Persons are classified into the following categories according to their marital status at the time of interview: Single; married, spouse present; and other marital status. The classification "married, spouse present" applies to husband and wife if both are reported as members of the same household even though one may be temporarily absent on business, vacation, on a visit, in a hospital, and the like at the time of interview. The term "other marital status" applies to persons who are married, spouse absent, widowed, or divorced.

Family. The term "family" as used here refers to a group of two persons or more related by blood, marriage, or adoption, and residing together; such persons are counted as members of one family. One person in each

13

family is designated as the "head." This person is usually regarded as the head by members of the family. Married women are not classified as heads if their husbands are living with them at the time of the survey. A lodger and his wife who are not related to the head of the family, or a resident employee whose wife lives with him are considered a separate family. However, a married couple or parent-child group related to the head of the family and sharing his living quarters is treated not as a separate family but as part of the head's family. The expression "husband-wife family" indicates that the head of the family is a married man whose wife (and perhaps other family members) lives with him.

Children. Data on children refer to "own" children of the family head and include sons and daughters, stepchildren, and adopted children.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: white, Negro, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except white and Negro.

Employed. Employed persons are all those who during the survey week (a) did any work at all as paid employees or in their own business or profession, or on their own farm, or worked 15 hours or more as unpaid workers in an enterprise operated by a member of the family, or (b) did not work but had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacations, labor-management dispute, or personal reasons, whether they were paid by their employers for the time off, or were seeking other jobs.

Unemployed. Unemployed persons are all those who did not work during the survey week, made specific efforts to find a job within the preceding 4 weeks, and were available for work during the survey week or would have been available except for temporary illness. Also included as unemployed are those who did not work at all, were available for work, and (a) were waiting to be called back to a job from which they had been laid off, or (b) were waiting to report to a new wage or salary job within 30 days.

Labor Force. The civilian labor force comprises all persons classified as employed or unemployed according to the above definitions. In this report, the labor force also includes male members of the Armed Forces who at the time of the survey were living off post or were living on post with their families.

Not in Labor Force. All persons not classified as employed or unemployed are defined as "not in the labor force." Persons doing only incidental un-

paid family work (less than 15 hours) are also classified as not in the civilian labor force.

Full-Time and Part-Time Workers. Full-time workers are persons who worked 35 hours or more during the survey week, or who usually work full time but worked 1 to 34 hours during the survey week. Part-time workers are those who usually work 1 to 34 hours and worked 1 to 34 hours during the survey week. Persons with a job but not at work during the survey week are classified according to whether they usually work full or part time.

Work Experience. Persons with work experience are those who worked as civilians at any time during the preceding calendar year at full-time or part-time jobs.

Weeks Worked. Persons with work experience are classified according to the number of weeks in which they did any work during the preceding calendar year as civilians for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Year-Round Full-Time Workers. Year-round full-time workers are persons who worked primarily at full-time jobs for 50 weeks or more during the preceding calendar year.

Part-Year Workers. Part-year workers are persons who worked either full time or part time for 1 to 49 weeks during the preceding calendar year.

Occupation, Industry, and Class of Worker. Data on occupation, industry, and class of worker refer to the job held in the survey week. Persons with two jobs or more are classified in the job at which they worked the greatest number of hours in the survey week. The occupation and industry categories in this report are the major groups used in the 1970 Census of Population.

Standard Metropolitan Statistical Area (SMSA). Except in New England, an SMSA is a county or group of contiguous counties which contain at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. The figures shown in this report for SMSA's are based on the SMSA's as defined on the basis of the 1970 Census.

Geographic Regions. The four major regions of the United States represent groups of States, as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

North Central: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

Income. Income is the total amount of money income received in the preceding calendar year from (1) money wages and salaries, (2) net income from self-employment, (3) Social Security, (4) dividends, interest (on savings and bonds), net rental income, and income from estates and trusts, (5) public assistance, (6) unemployment and workmen's compensation, government employee pensions, and veterans' payments, and (7) private pensions, annuities, alimony, regular contributions from persons not living in the same household, net royalties, and other periodic income. The amount received represents income before deductions for personal taxes, Social Security, savings bonds, union dues, health insurance, and the like. The total income of a family is the algebraic sum of the amounts received by all persons in the family.

Earnings. Earnings are all money income of \$1 or more from wages and salaries, and net money income of \$1 or more from farm and nonfarm self-employment.

Median. The median is the value which divides the distribution into two equal parts, one part having values above the median, and the other having values below the median.

The medians as shown in this report are calculated from the corresponding distributions by linear interpolation within the interval in which the median falls. Therefore, because of this interpolation, the median value depends not only on the distribution of income but also on the income intervals used in calculating the median.

Sums of Distribution. Sums of individual items, whether absolute numbers or percentages, may not equal totals because of independent rounding of totals and components. Percentage totals, however, are always shown as 100 percent.

### RELIABILITY OF THE ESTIMATES

Estimating Procedure. The estimating procedure used in this survey inflates weighted sample results to independent estimates of the civilian non-institutional population by age, sex, and race. These independent estimates are based on statistics from the 1970 Census of Population and other data on births, deaths, immigration, emigration, and strength of the Armed Forces.

6

To these figures were added the male members of the Armed Forces living off post or with their families on post.

Variability. Since the estimates are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules and procedures. As in any survey, the results are also subject to errors of response and reporting. These may be relatively large in the case of persons with irregular attachment to the labor force. Particular care should be exercised in the interpretation of figures based on relatively small estimates as well as small differences between figures.

The standard error is primarity a measure of sampling variability, that is, of the variations that might occur by chance because a sample rather than the entire population is surveyed. As calculated for this report, the standard error also partially measures the effect of response and enumeration errors but does not measure any systematic biases in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error. Tables 1 through 4 show approximations of the standard errors of estimates of various characteristics of persons; tables 5 and 6 pertain to families. These tables provide an indication of the order of magnitude of the standard error rather than a precise standard error for any specific item.

The following example illustrates their use. An estimated 19, 821, 000 married women were in the labor force in March 1973. From table 1, the chances are about 68 out of 100 that the difference between the sample estimate and a complete census count would be less than 244, 000. The chances are about 95 out of 100 that the difference would be less than 488, 000. The 19, 821, 000 married women represented 42.2 percent of all married women in the population. Table 3 shows the standard error of 42.2 percent with a base of 46, 939, 000 to be about 0.4 percent. Thus, the chances are 68 out of 100 that a complete census count would have resulted in a figure between 41.8 and 42.6 percent, and 95 out of 100 that the figure would have been between 41.4 and 43.0 percent.

For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squares of the standard errors of each estimate considered separately  $(s_0 = \sqrt{(s_1)^2 + (s_2)^2})$  where  $s_0$  is the standard error of the difference and  $s_1$  and  $s_2$  are the standard errors of the estimates).

•

To illustrate this, table A of this report shows that in March 1973, the labor force participation rate of married women, husband present, was 42.2 percent, and the rate for single women was 55.8 percent, an apparent difference of 13.6 percentage points. Table 3 shows the standard error of 42.2 percent on a base of 46, 939, 000 married women to be approximately 0.4 and the standard error of 55.8 percent on a base of 13,879 single women to be approximately 0.8. Thus, the standard error of the estimated difference of 13.6 percentage points is  $0.9 = \sqrt{(0.4)^2 + (0.8)^2}$ . This means the changes are 68 out of 100 that the estimated difference based on the sample would differ from the difference derived using complete census figures by less than 0.9 percentage points and 95 out of 100 that it would differ by less than 1.8 percentage points. Therefore, the conclusion is that at both levels of confidence the labor force participation rate of single women is greater than that of married women. Of course, should the standard error be equal to -or greater than -- the estimated difference of percentages based on the sample, there would be no significant difference between the percentages.

The reliability of an estimated percentage that is based on sample data depends on the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerator of the percentage, particularly if the percentage is large (50 percent or greater).

For a more complete description of the methodology, see Concepts and Methods Used in Manpower Statistics from the Current Population Survey, U.S. Department of Commerce and U.S. Department of Labor (1967), Report 313.

# U. S. GOVERNMENT PRINTING OFFICE: 1974 543-670/34

<sup>1/</sup> Professional. managerial, clerical and sales workers.
2/ Craft and kindred workers, operatives, and nonfarm laborers.
3/ SMSA refers to a Standard Metropolitan Statistical Area. Except in New England, this is a group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. The city in the title of an SMSA is the central city.
4/ Widowed, divorced, and husband absent.
